

INDUSTRIAL HOSES - compensators

In any pipeline exposed to temperature variations, vibrations, assembly stress, external impact and deformations, it is necessary to insert flexible parts such as hoses or expansion joints (compensators) in order to absorb movements of an installation. Bellow expansion joints can be installed in steam, water, gas, air, oil, chemicals, food and dry products pipelines.

Expansion joints are usually used to:

- accommodate thermal expansion of the pipeline,
- reduce stress in the pipeline,
- absorb vibrations and dampen noise,
- facilitate pipeline installation and assembly of couplings and valves.

Compensators are usually classified according to the kind of material the bellow (the basic part of all expansion joints with bellows) is made of:

- rubber expansion joints: the bellow is made of rubber reinforced with synthetic or steel cord (the kind of rubber depends on the working conditions of the compensator, medium, temperature, etc.), working temperature usually ranges up to +90°C (optionally up to +130°C),
- steel expansion joints: the bellow is made of AISI 321 acid resistant steel, steel compensators resistant to high temperature, corrosion and aggressive chemicals. Characterized by good mechanical characteristics and high fatigue strength.
- PTFE expansion joints: the bellow is made of annularly corrugated, thick-walled PTFE tube. They make a group of flexible joints with the highest grade of chemical resistance.
- fabric expansion joints made of fibreglass fabric optionally coated with silicone or PTFE layer. High chemical and temperature resistance. Designed to transfer exhaust fumes, gases, dust, and other fumes.

INDUSTRIAL HOSES - compensators

Rubber compensators

Working parameters of rubber expansion joints

The working parameters of rubber compensators given in the tables (working pressure, working temperature and displacement) are the maximum values and they must not occur simultaneously. The working pressure applies to the expansion joint working in the temperature of up to +50°C. At elevated temperatures, it is required to reduce the values given in the table regarding the maximum working pressure and displacement. The values of permissible vacuum pressure given in the tables apply to the compensators without vacuum supporting rings. A stainless steel ring can be fitted in the bellow of the rubber expansion joint if it is necessary. In that case the compensator can operate in the conditions of vacuum pressure or even close to full vacuum. Please contact Sales or Technical Department in the event of any doubts concerning permissible working parameters of the expansion joints in particular application.

| compensator type | working temperature | displacement | bellow maximum working pressure [bar] | | |
|---|---------------------|--------------|---------------------------------------|------|------|
| | | | PN10 | PN16 | PN25 |
| E-RE, E-CR, E-GR, E-YE, E-YL, E VITON, E-WH, E-BR | +50°C | 100% | 10 | 16 | - |
| | +70°C | 80% | 8 | 12 | - |
| | +100°C | 60% | 6 | 10 | - |
| E-LPG | +50°C | 100% | - | - | 25 |
| | +70°C | 80% | - | - | 20 |
| | +100°C | 60% | - | - | 15 |
| E-RP | +50°C | 100% | 10 | - | - |
| | +70°C | 80% | 8 | - | - |
| | +100°C | 60% | 6 | - | - |
| E-RX | +70°C | 100% | 10 | 16 | - |
| | +100°C | 75% | 7.5 | 12 | - |
| | +130°C | 50% | 5 | 8 | - |
| E-YS | +60°C | 100% | 10 | 16 | - |
| | +100°C | 60% | 6 | 10 | - |
| 115 EPDM, 115NBR | +50°C | 100% | 10 | 16 | - |
| | +70°C | 80% | 8 | 12 | - |
| | +90°C | 60% | 6 | 10 | - |
| T-EPDM, T-NBR, 1504 | +40°C | 100% | 10 | 16 | - |

| | +80°C | 80% | 4 | 6.5 | - |
| | +100°C | 60% | 2.5 | 4 | - |

Installation of rubber compensators

Rubber expansion joints are supplied as ready-to-use solutions. The compensators should not be covered and be accessible to regular maintenance. Rubber parts must not be covered with paint. During any welding work the bellow has to be covered up to protect it against high temperature and sparks. Permissible displacement, temperature, pressure and quality of rubber should be examined before installation. The pipes should be fixed to a base to eliminate any forces resulting from internal pipe pressure. To utilize the permissible displacement the distance between two pipe anchor points should be the same as the length of the compensator.

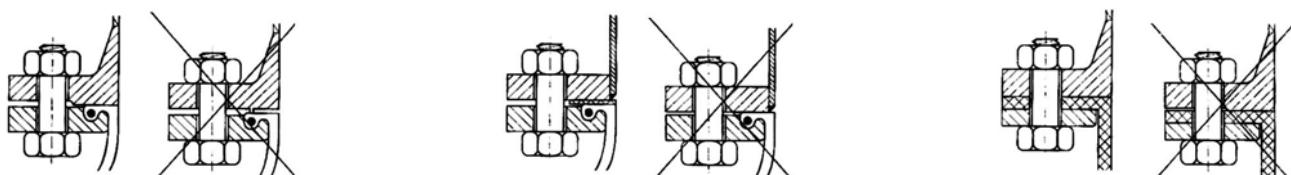

fig. 2

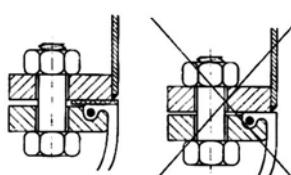

fig. 3

fig. 4

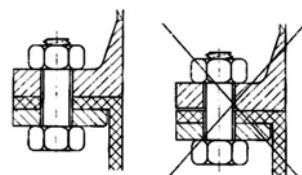

fig. 5

fig. 6

INDUSTRIAL HOSES - compensators

Rubber compensators

Joining screws should be fixed with their heads facing rubber bellow to allow displacements given in technical specifications. If it is not possible, threaded screws should not protrude more than 2 ÷ 3 mm, to avoid damage of the bellow. Nuts should be tightened up one after another diagonally during mounting and again after installation start-up. If the screws and nuts are tightened up too hard, the seal can be crushed.

For safety reasons as well as to ensure the longest service life of an expansion joint, counter flanges have to be mounted properly (fig. 1 ÷ 6).

The seal of a counter flange has to be smooth and cover most of rubber surface (at least 60%) so as to provide right sealing (fig. 1). The compensators with full rubber flanges demand full and perfectly smooth counter flanges (fig. 5).

- fig. 1 - flange with smooth seal,
- fig. 2 - grooved and recess flanges must not be used, they damage rubber,
- fig. 3 - flange with plane seal in order to protect rubber surface,
- fig. 4 - sharp edges of the pipe can damage rubber surface,
- fig. 5 - full rubber flanges require full counter flanges to obtain proper sealing,
- fig. 6 - counter flange with a pad can both damage rubber surface and prevent tight contact.

Never cover rubber parts of a compensator with any paint or lubricant.

During any welding work the bellow has to be covered up to protect it against high temperature and spatter.

Before installation:

- remove dust and any foreign material that entered a compensator,
- a compensator should be secured against accidental or deliberate damage,
- any oil or lubricant must not fall on a compensator.

During start-up:

- check, if there is any leakage,
- if there is a need, check expansion limiters.

During service:

- a compensator must be easily accessible, not covered with any insulating material or paint,
- as soon as compensators start to work, it is essential to be sure its movements do not exceed permissible limits.

Maintenance:

- any kind of changes in the outer layer may indicate serious deformation,
- check screws tightening,
- check the range of compensator movements, that should be within permissible limits.

NOTE!

- the working parameters of compensators listed in the tables are the maximum values and must not occur simultaneously,
- working pressure applies to the compensator operating in the temperature of +20°C,
- the values of permissible vacuum pressure given in the tables apply to the rubber compensators without vacuum supporting rings. A stainless steel ring can be fitted in the bellow of the rubber compensator if it is necessary. In that case the expansion joint can operate in the conditions of vacuum pressure or even close to full vacuum.
- the permissible displacement values given in the tables apply to the compensators operating in the temperature of up to +50°C.

INDUSTRIAL HOSES - compensators

Rubber compensators

T - EPDM

Internal layer: EPDM rubber
Reinforcement: Nylon cord
External layer: EPDM rubber
Flanges: Galvanized carbon steel
Working temp.: Up to +100°C
 (depending on the medium)

Designed for installations transferring hot and cold water, cooling water with water treatment additives, drinking water, industrial water, chlorine solutions, glycols, acids, whitewash, esters, ketones, seawater. Not suitable for fluids with oil content. PZH (National Institute of Hygiene, Poland) certificate for contact with drinking water.

INDUSTRIAL HOSES - compensators

115 EPDM

Internal layer: EPDM rubber
Reinforcement: Nylon cord
External layer: EPDM rubber
Flanges: Galvanized carbon steel
Working temp.: From -30°C up to +90°C
 (depending on the medium)

Designed for installations transferring hot and cold water, water with water treatment additives, industrial water, seawater, glycols, weak acids, bases, esters and ketones. Not suitable for fluids with oil content. BV (Bureau Veritas) Certificate.

INDUSTRIAL HOSES - compensators

Rubber compensators

1504

Internal layer: EPDM rubber
Reinforcement: Nylon cord
External layer: EPDM rubber
Connections: BSP male thread, cast iron, zinc-plated
Working temp.: From -10°C up to +100°C
 (depending on the medium)

Designed to absorb vibration and linear or angular displacement in water installation. Not suitable for fluids with oil content. PZH (National Institute of Hygiene, Poland) certificate for contact with drinking water.

| code | nominal diameter [mm] | thread size [inch] | length [mm] | compression [mm] | expansion [mm] | lateral movement [mm] | angular movement [degrees] | working pressure [bar] |

E - RP

Internal layer: Butyl rubber (IIR) / EPDM
Reinforcement: Nylon cord
External layer: EPDM rubber
Flanges: Galvanized carbon steel
Working temp.: From -40°C up to +90°C
 (with peaks up to +120°C depending on the medium)

Intended for sanitary installations, cold or hot water, swimming pool water, seawater and drinking water. Not suitable for mineral oils, cooling water with oil-based anti-corrosion additives, oily air and any installation where the constant working pressure exceeds 10 bar. Marked with a single red dot on a bellow.

INDUSTRIAL HOSES - compensators

Rubber compensators

E - CR

Internal layer: CR rubber
Reinforcement: Nylon cord
External layer: CR rubber
Flanges: Galvanized carbon steel
Working temp.: From -25°C up to +90°C
 (with peaks up to +100°C depending on the medium)

Designed for installations transferring hot and cold water (not drinking water), seawater, cooling water with water treatment additives, municipal sewage, oily water, compressed air (not hot). Not suitable for heating oil, diesel, petrol or other petrochemical products, acids and bases. Marked with CR letters on a bellow, no stripe.

E - RE

Internal layer: Butyl rubber (IIR) / EPDM
Reinforcement: Nylon cord
External layer: EPDM rubber
Flanges: Galvanized carbon steel
Working temp.: From -40°C up to +100°C
 (with peaks up to +120°C depending on the medium)

Designed for installations transferring water, seawater, cooling water with water treatment additives, drinking water, low concentration acids and bases, solutions of salts, esters and ketones. Not suitable for mineral oils, cooling water with oil-based anti-corrosion additives, oily air. Marked with a single red stripe on a bellow.

INDUSTRIAL HOSES - compensators

Rubber compensators

E - YE

Internal layer: NBR rubber
Reinforcement: Nylon cord
External layer: CR rubber
Flanges: Galvanized carbon steel
Working temp.: From -20°C up to +90°C
 (with peaks up to +100°C depending on the medium)

Designed for installations conveying petrochemical products with aromatic content up to 50%, oily air, natural gas (not LPG), oily water, cooling water with anti-corrosion additives. Marked with a single yellow stripe on a bellow.

E - YL

Internal layer: NBR rubber
Reinforcement: Nylon cord
External layer: CR rubber
Flanges: Galvanized carbon steel
Working temp.: From -40°C up to +90°C
 (with peaks up to +100°C depending on the medium)

Designed for installations conveying petrochemical products, petrol, diesel, heating oil, JET A1 jet fuel, kerosene. Marked with a single yellow stripe and white LT letters on a bellow.

INDUSTRIAL HOSES - compensators

Rubber compensators

E - RX

Internal layer: EPDM rubber
Reinforcement: Polymer cord
External layer: EPDM rubber
Flanges: Galvanized carbon steel
Working temp.: From -40°C up to +130°C
 (with peaks up to +150°C depending on the medium)

Designed for installations conveying hot water, cooling water, hot air. Not suitable for mineral oils, cooling water with oil-based anti-corrosion additives, oily air. Marked with a double red stripe on a bellow.

| code | I.D. [mm] | DIN 2501 flange PN | length [mm] | axial movement [± mm] | lateral movement [± mm] | angular movement [± degrees] | working pressure [bar] | vacuum [bar] |

E - LPG

Internal layer: Conductive NBR rubber
Reinforcement: Nylon cord
External layer: Conductive CR rubber
Flanges: Galvanized carbon steel
Working temp.: From -20°C up to +90°C
 (with peaks up to +100°C depending on the medium)

Designed for application in tankers, fuel installations and petrol stations to transfer LPG (Liquid Petroleum Gas) according to EN 589. Germanisher Lloyd Certificate. Available with ASA 300 flanges. Marked with a single orange stripe on a bellow.

| code | I.D. [mm] | DIN 2635 flange PN | length [mm] | axial movement [± mm] | lateral movement [± mm] | angular movement [± degrees] | working pressure [bar] | vacuum [bar] |
|-------------|--------------|--------------------------|----------------|-----------------------------|-------------------------------|------------------------------------|------------------------------|-----------------|

| TG-E-OR-100 | 100 | 40 | 130 | 30 | 30 | 30 | 25 | 1 |

INDUSTRIAL HOSES - compensators

Rubber compensators

E - VITON

Internal layer: FPM (Viton)
Reinforcement: Rubber-coated Nylon cord
External layer: Conductive ECO rubber
Flanges: Galvanized carbon steel
Working temp.: From -15°C up to +90°C
 (with peaks up to +130°C depending on the medium)

Designed for chemical and petrochemical installations, sulphur removal, application in power plants, etc. Extremely resistant to the influence of hot oils, benzene, xylene, products with aromatic content up to 50%, biodiesel and other aggressive media. Marked with a white-green-white stripe on a bellow.

| code | I.D. [mm] | DIN 2501 flange PN | length [mm] | axial movement [± mm] | lateral movement [± mm] | angular movement [± degrees] | working pressure [bar] | vacuum [bar] |

E - YS

Internal layer: HNBR rubber
Reinforcement: Steel cord
External layer: CR rubber
Flanges: Galvanized carbon steel
Working temp.: From -35°C up to +100°C
 (with peaks up to +120°C depending on the medium)

Intended for installations conveying chemical or petrochemical products with aromatic content up to 50%, cooling water with oil-based anti-corrosion additives, lubricating and hydraulic oil, seawater. Marked with a yellow-blue-yellow stripe on a bellow.

| code | I.D. [mm] | DIN 2501 flange PN | length [mm] | axial movement [± mm] | lateral movement [± mm] | angular movement [± degrees] | working pressure [bar] | vacuum [bar] |

INDUSTRIAL HOSES - compensators

Rubber compensators

E - BR

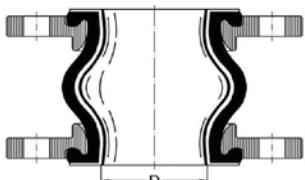

Internal layer: BR/NR rubber
Reinforcement: Polyester cord
External layer: BR/NR rubber
Flanges: Galvanized carbon steel
Working temp.: From -50°C up to +70°C
(with peaks up to +90°C depending on the medium)

Due to superior abrasion resistance compensators are suitable for the transfer of such media as: suspensions, sediment, emulsion, water with all kinds of additives, with solid particles, with abrasive effect. They are not designed to transfer media containing oils, fats or petrochemical products. Marked with a single blue dot on a bellow.

| code | I.D. [mm] | DIN 2501 flange PN | length [mm] | axial movement [± mm] | lateral movement [± mm] | angular movement [± degrees] | working pressure [bar] | vacuum [bar] |

INDUSTRIAL HOSES - compensators

Rubber compensators - accessories for E type

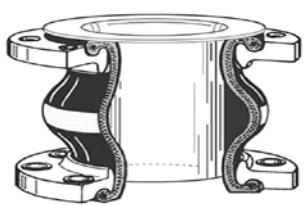

Internal PTFE liner

PTFE liner is applied when chemical resistance of rubber bellows is not sufficient for the medium. Suitable for almost all media. Available for compensators in the range of DN25 ÷ DN300 in diameter. Supplied integrated with a rubber compensator (factory-mounted). If the liner is used, displacement values given in the catalogue must be reduced by about 50%. Suitable for working pressure up to 6 bar. Not suitable for vacuum.

Internal PTFE liner + PTFE vacuum ring

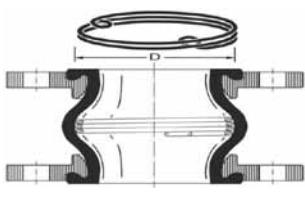

Parameters are the same as for PTFE liner (see above) although with an additional PTFE ring it can be used for vacuum but only in the temperature up to +70°C.

Internal flow liner

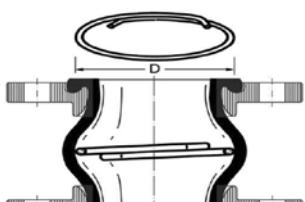

Made of 1.4571(AISI 316Ti) steel as a standard, applied when abrasive media may mechanically damage a rubber bellow (e.g. granules). Available for compensators in the range of DN 25÷DN600 in diameter. It can be from 1 to 3 mm thick depending on a diameter. The flow liner significantly reduces angular and lateral movement of the compensator.

Note: When the flow liner is used, the working diameter of the compensator is reduced. It is crucial to put a gasket between the flow liner and counter flange of a pipeline.

Internal supporting steel spiral

Applied when the value of working vacuum in a pipeline is higher than the vacuum of a particular compensator. Available for compensators in the range of DN50 ÷ DN300 in diameter. Made of 1.4571(AISI 316Ti) steel. The number and thickness of convolutions depend on the nominal diameter of the compensator. If the spiral is used, displacement values given in the catalogue must be reduced by about 50%.

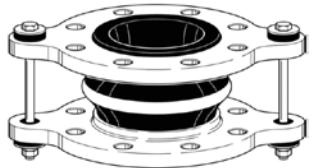

Internal supporting steel ring

Applied when the value of working vacuum in a pipeline is higher than the vacuum of a particular compensator. Available for compensators in the range of DN125 ÷ DN600 in diameter. Made of 1.4571(AISI 316Ti) steel. If the ring is used, displacement values given in the catalogue must be reduced by about 50%.

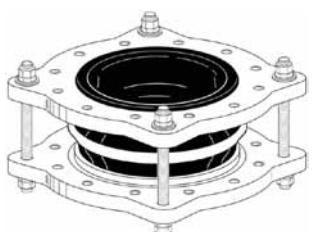

INDUSTRIAL HOSES - compensators

Rubber compensators - accessories for E type

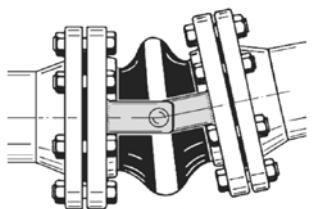

Tie rods

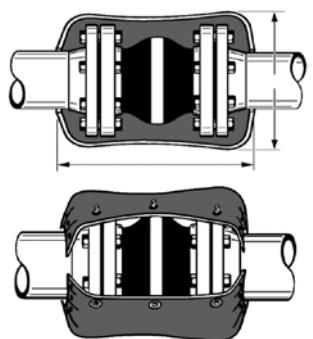

Tie rods are recommended when no sufficiently solid fix points can be built into an installation in order to transmit the reactive force from this installation. The force comes from the internal pressure. Available as a set integrated with the flanges of a compensator. For diameters up to DN300 they include rubber washers that additionally dampen noise and vibration.

For diameters above DN350 tie rods include steel washers (spherical and conical).

Custom made (only for angular displacement).

Fire-retardant protective cover

Made of several layers of fibreglass fabric with external silicone-aluminum-fibreglass layer. Designed for overall protection of a rubber compensator against direct impact of a very high temperature or even flame in the temperature up to +800°C for up to 30 minutes. The cover is also resistant to oil, chemicals and weather conditions. It is big enough to protect counter flanges of the installation as well. It has no impact on the permissible displacement of the compensator.

INDUSTRIAL HOSES - compensators

Steel compensators

Steel compensators are designed to absorb a particular amount of displacement of the pipeline according to specified working conditions and size. In order to obtain the maximum service life in the conditions of working pressure follow the recommendations listed below:

Before installation

Check if the compensator delivered to the installation spot has not been damaged during shipment. Any damage caused to the steel bellow may severely shorten service life of the compensator. Only if the assembly of installation is completed, the compensator can be fitted into position. It applies to pipe supports or moving props of the piping system in particular.

The compensator must not be used as a pipeline support neither carry its load. No torsion or rotation - an outcome of stress occurring in the pipeline during installation or service must be imposed on the compensator.

During installation

No mechanical impact e.g. heavy blow should be imposed on a compensator. It is unacceptable to drop the compensator on hard surface. Do not use rope or chain directly on the bellow to lift the compensator during installation. The compensators with internal sleeves should be installed pointing the flow direction. It is essential to maintain the alignment of the compensator with the pipeline during installation.

Nuts of compensators with flanges should be tightened up one after another diagonally in several attempts. The space left for the compensator in the pipeline must be exactly the same as the length required to install the compensator.

After installation

Remove all shipping bars and other devices employed to keep the initial stress of the compensator (if there were any). Check if the compensator has not been damaged during shipment. No foreign material can be trapped between the corrugations of the bellow. Check if all pipe guides and supports are adequate before pressure test of the installation. Never exceed the maximum working pressure. If the pipeline is covered with insulating coating, do not allow the material of the coating to enter the corrugation of the bellow.

During service

Working pressure and displacement of the compensator shall never exceed the permissible values. It is crucial to avoid pressure jumps caused either by faulty equipment or its malfunction. If the working conditions of installations such as pressure or temperature change it is recommended to re-examine the adequacy of the compensator for these modified working conditions.

Maintenance

Steel compensators are virtually maintenance-free. They only require periodic visual inspection during service. In case of any malfunction - leakage, cracks, signs of corrosion or damage of steel bellows in particular, the compensator must be replaced with a new one. Steel compensators are unrecoverable.

Temperature correction factor for steel compensators

The working parameters of steel compensators given in the tables are for the maximum working pressure of each particular type: 2.5 - 10 - 16 bar and for the temperature of +120°C.

In order to calculate the maximum working pressure for working temperature other than the one specified in the parameters, use the correction factors given in the table below.

| working temperature [°C] | 20 | 50 | 100 | 120 | 150 | 200 | 250 | 300 | 350 | 400 | 450 | 500 | 550 |
|--------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| correction factor | 1.183 | 1.095 | 1.026 | 1.000 | 0.962 | 0.912 | 0.863 | 0.823 | 0.794 | 0.769 | 0.750 | 0.735 | 0.725 |

INDUSTRIAL HOSES - compensators

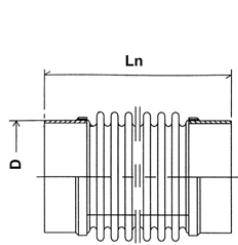

Steel compensators

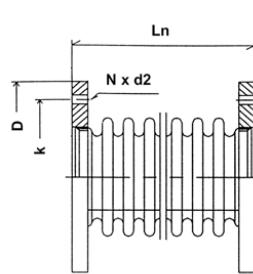

AX1T - PN 16

AX1SU-16: Welding ends
AX1FU-16: EN 1092-1 fixed flanges
AX1BU-16: EN 1092-1 swivel flanges
Material: AISI 321
Flanges: Carbon steel
Welding ends: Carbon steel
Working temp.: Up to +550°C
Working press.: Up to 16 bar
 (apply the temperature correction factor for temperatures above +120°C)

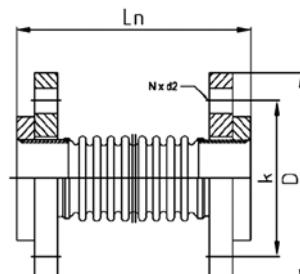

Axial compensators designed for application in pipelines to compensate axial and lateral movements. Stainless steel ends and compensators longer than standard are available on request.

INDUSTRIAL HOSES - compensators

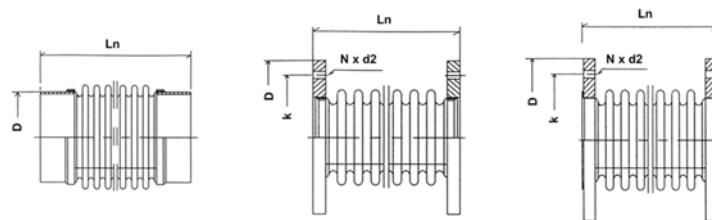

Steel compensators

US3 - PN 2.5

| | |
|------------------------|--|
| US3SU-03: | Welding ends |
| US3FU-03: | Fixed flanges according to DIN 86044 |
| US3BU-03: | Swivel flanges according to DIN 86044 |
| Material: | AISI 321 |
| Flanges: | Carbon steel |
| Welding ends: | Carbon steel |
| Working temp.: | Up to +550°C |
| Working press.: | Up to 2.5 bar (apply the temperature correction factor for temperatures above +120°C) |

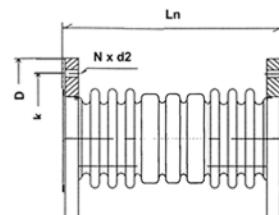

Compensators designed for application in exhaust fumes systems to compensate axial and lateral movements.

INDUSTRIAL HOSES - compensators

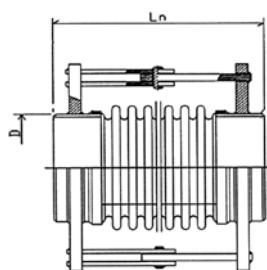

Steel compensators

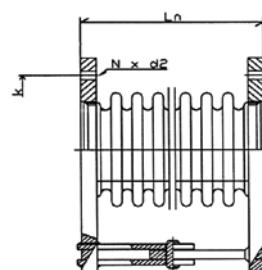

AN1 H - PN 10

AN1SH-10: Welding ends
AN1FH-10: Fixed flanges
Material: AISI 321
Flanges: Carbon steel
Welding ends: Carbon steel
Working temp.: Up to +550°C
Working press.: Up to 10 bar
 (apply the temperature correction factor for temperatures above +120°C)

Compensators designed for application in pipelines to compensate angular movements.

INDUSTRIAL HOSES - compensators

Steel compensators

LA1 - PN 16

LA1ST-16: Welding ends
LA1FT-16: Fixed flanges
Material: AISI 321
Flanges: Carbon steel
Welding ends: Carbon steel
Working temp.: Up to +550°C
Working press.: Up to 16 bar
 (apply the temperature correction factor for temperatures above +120°C)

Compensators designed for application in pipelines to compensate lateral movements.

LA1ST-16 type

INDUSTRIAL HOSES - compensators

PTFE compensators

Working parameters of PTFE compensators

The working parameters of compensators listed in the tables (working pressure, temperature) are the maximum values and must not occur simultaneously. At elevated temperatures, it is required to reduce the values given in the table regarding the maximum working pressure. Please contact Sales or Technical Department of TUBES INTERNATIONAL® in the event of any doubts concerning permissible working parameters of the compensator in particular application.

| compensator type | working \ temperature | maximum working pressure [bar] | | |

INDUSTRIAL HOSES - compensators

PTFE compensators

R-LD, R, R-HD type

Material: PTFE (also antistatic)

Reinforcement: Stainless steel rings

Flanges: Ductile cast iron GGG 40 with tie rods

Working temp.: Up to +235°C

PTFE compensators are made of helically corrugated bellow finished with flanges. Reinforced with external rings made of stainless steel. Flanges made according to ASA and DIN standards. Special versions are also available: double walled bellow with a draining system, with carbon steel or stainless steel flanges, with reinforcing rings made of Monel 400 or Hastelloy N4, with internal pilot ferrule.

Due to such advantages as good flexibility of connection, very good chemical and thermal resistance and self-cleaning properties they are widely used in chemical, food and pharmaceutical industry.

R-LD type 6 bar

NOTE!

* in code number refers to number of convolutions e.g. TB-R-300-3 refers to a "R" type compensator, DN 300 with 3 convolutions.

INDUSTRIAL HOSES - compensators

Fabric compensators

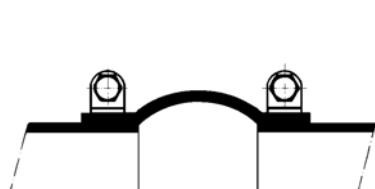

Fabric compensators are designed for cold and hot air installations, ventilation and air-conditioning systems, power plant exhaust fumes systems, to transfer loose products, etc.

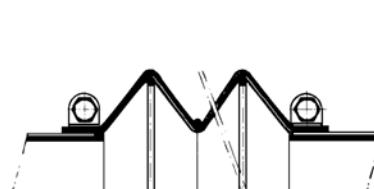

Bellows of the compensators can be made of polyester or aramid fabric, fibreglass or ceramic fabric, fabric impregnated with EPDM rubber, Hypalon, silicone, Viton. All building materials are free of asbestos. The choice of adequate bellow material depends on the medium and its temperature (from +100°C up to +1000°C).

As textile materials are flexible and malleable they can be used to produce compensators of any cross-section e.g. circular, oval, rectangular. A set of layers, dimensions and shape of the compensator are selected individually for each item. Bellows can be flat, corrugated, with or without reinforcing rings, with diameter reduction, with flow liners. The liners are used to guide the stream inside the compensator. Recommended for abrasive products, at high flow rates, in high contamination of particulate media in order to reduce impurities build-up on the bellow walls.

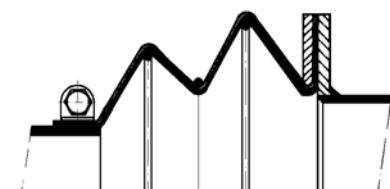

Examples of fabric compensator design

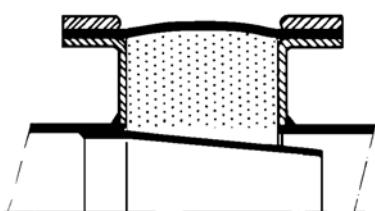

sleeve compensator

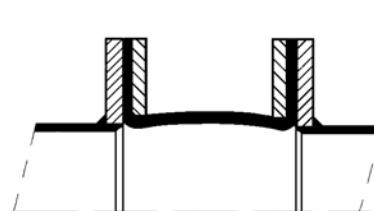

corrugated compensator

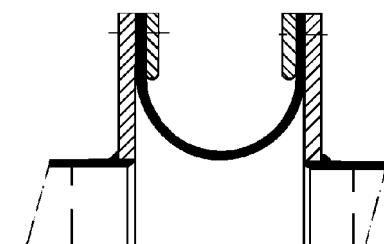

corrugated compensator with sleeve and flange ends

compensator with insulation and flow liner

flanged compensator

flanged compensator

INDUSTRIAL HOSES - compensators

Elastomeric compensators

An elastomer is a synthetic or natural polymer material, with ability to return to its original shape after deformation caused by mechanical stress, without any damage to its structure. The group of elastomers comprises a wider variety of materials than rubber, which is only one of the classes within this group. The elastomer has the ability to undergo deformation in a wide range of its dimensions under the influence of tensile, shear or compressive force and regain its original dimensions once the force has been removed.

Elastomeric compensators are intended to work in constant working temperature reaching above +200°C (depending on a bellow material). Each compensator is made of an elastomeric material with one or more layers of reinforcement vulcanized together to form one robust and resistant material. There is no standard set of dimensions for this type of compensators so they can be freely manufactured in any shape or dimension. Available as round, rectangular or oval with length adjusted to fit the installation. The length of these compensators is not fixed as it depends on displacement that is to be absorbed by the compensator. This type of compensators is the best choice for the transfer of wet gases and exhaust in ducting of hot air or chimney installations. They can efficiently absorb multidirectional displacement and vibration of hose assemblies and any incidents of misalignment.

There are four basic materials used to make elastomeric compensators:

EPDM - Resistant to the influence of hot air, unoiled exhaust gases and weather conditions. Not intended for contact with fat, oils and petrochemicals. Suitable for installations with a constant working temperature up to +120°C and working pressure up to 50 kPa.

FKM (Viton B) - Excellent resistance to chemicals and high temperature. Resistant to the chemical impact of mineral oil and acid particles contained in exhausts as well as sulphur compounds (SO and H₂S) in carbon and mineral oil exhausts. Suitable for dry and wet installations with a constant working temperature up to +200°C and working pressure up to 50 kPa.

PTFE - Combines excellent resistance to the majority of chemicals with high mechanical strength and low weight. Frequently used in sulphate removal installations where other materials are easily damaged by toxic compounds. Suitable for installations with a constant working temperature up to +250°C and working pressure up to 50 kPa.

SI (Silicone) - Temperature resistance is similar to Viton. It maintains its mechanical properties in a very wide range of temperatures. Used in e.g. food industry as it is taste and odour free. Resistant to extreme weather conditions, but not resistant to acids, oils and abrasion. Suitable for dry and wet installations with a constant working temperature up to +200°C (temporarily even higher) and working pressure up to 20 kPa.
